

**BM 3: I CAN DETERMINE END BEHAVIOR OF A FUNCTION FROM ITS GRAPH**

Khan Academy video: End Behavior of Polynomials  
(link posted at [usamath.weebly.com](http://usamath.weebly.com))

Consider the quadratic function  $y = ax^2 + bx + c$ .

When  $a > 0$ , the parabola opens \_\_\_\_\_ and the graph looks like  
When  $a < 0$ , the parabola opens \_\_\_\_\_ and the graph looks like

Consider the cubic function  $y = ax^3 + bx^2 + cx + d$ .

When  $a > 0$  and  $x$  is really negative, the whole thing is \_\_\_\_\_. But as  $x$  gets more and more positive, it gets more \_\_\_\_\_. So when  $a > 0$ , the graph looks like:

Consider the cubic function  $y = ax^3 + bx^2 + cx + d$ .

When  $a < 0$  and  $x$  is really negative, you multiply that by a negative and you get a \_\_\_\_\_ value, the whole thing is \_\_\_\_\_. So when  $a < 0$ , the graph looks like:

<p>End Behavior describes what happens at _____ of <math>x</math>.</p>
--

Consider the 4<sup>th</sup> degree polynomial (quartic)  $y = ax^4 + bx^3 + cx^2 + dx + f$ .

When  $a > 0$ , the graph looks like \_\_\_\_\_ When  $a < 0$ , the graph looks like \_\_\_\_\_

Consider the 5<sup>th</sup> degree polynomial (quintic)  $y = ax^5 + bx^4 + \dots$

When  $a > 0$ , the graph looks like

When  $a < 0$ , the graph looks like

Khan Academy notes: End Behavior of Polynomials  
(link posted at [usamath.weebly.com](http://usamath.weebly.com))

The END BEHAVIOR of a function  $f$  describes:

Consider the graph to the right.

As  $x$  gets larger and larger,  $f(x)$  gets larger and larger as well.

- Mathematically, we write as  $x \rightarrow$  ,  $f(x) \rightarrow$
- Verbally, we say \_\_\_\_\_

---

---

On the other end, as we move to the left along the  $x$ -axis, the graph of  $f$  goes down. This means as  $x$  gets more negative,  $f(x)$  also gets more negative.

- Mathematically, we write as  $x \rightarrow$  ,  $f(x) \rightarrow$
- Verbally, we say \_\_\_\_\_

---

---

Here is the graph of  $g(x)$ . Use symbols and words to describe the end behavior.
